

(a)

leaves of three sizes;
grey: the mean contrast of the leaf

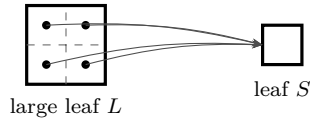

(b)

one pass over the leaves, no solve: each leaf
projects the wave on its polynomials and radiates
its exact Born term times $1 + E_p(\mathbf{k}_{in}, \mathbf{k}_{out}, h)$

(c)

$$\mathbf{K}(S, L) = \sum_{d \subset L} \mathbf{K}(S, d) \mathbf{R}_d$$

L re-expanded on its descendants d
at the size of S :
only blocks between equal cells
