

(a)

$$\int G \frac{\partial m}{\partial y_c} = - \int \frac{\partial G}{\partial y_c} m = + \int \frac{\partial G}{\partial x_c} m$$

the derivative on m moves onto $\mathbf{G}(\mathbf{x} - \mathbf{y})$ by parts,
and $-\partial/\partial y_c = +\partial/\partial x_c$: a receiver derivative

(b)

$\mathbf{K}$: force and moment of the source cell
→ displacement and strain at the receiver
